1. Write a statement that displays the address of the variable `testvar`.

cout << &testvar;.

2. The contents of two pointers that point to adjacent variables of type `float` differ by ___________.

sizeof(float)

3. A pointer is
   a. the address of a variable.
   b. an indication of the variable to be accessed next.
   c. a variable for storing addresses.
   d. the data type of an address variable.

d. the data type of an address variable.

4. Write expressions for the following:
   a. The address of `var`
   b. The contents of the variable pointed to by `var`
   c. The variable `var` used as a reference argument
   d. The data type pointer-to-`char`

a. The address of &var
b. The contents of the variable pointed to by *var
c. The variable var used as a reference argument &var
d. The data type pointer-to-char char *

5. An address is a *constant* while a pointer is a *variable*

6. Write a definition for a variable of type pointer-to-`float`.

float* ptr;

7. Pointers are useful for referring to a memory address that has no name

8. If a pointer `testptr` points to a variable `testvar`, write a statement that represents the contents of `testvar` but does not use its name.

***testptr**
